Project Name	Auto Ticket Classification using Flow Design	Max Marks	4 Marks

IDEATION PHASE — BRAINSTORM & IDEA PRIORITIZATION TEMPLATE

Auto Ticket Classification

Automating customer support ticket routing and triage using intuitive flow-based logic and natural language routing models.

-  10 mins prep
-  1 hour session
-  2-6 participants

Step 1: Before You Collaborate

- ✓ **Team Gathering**
Assemble cross-functional support, product, and workflow engineers.
- ✓ **Set the Goal**
Design a visual flow process to accurately classify support tickets automatically.
- ✓ **Tool Readiness**
Utilize flow diagrams and rule-based decision nodes for stream mapping.

DEFINE YOUR PROBLEM STATEMENT

HOW MIGHT WE STATEMENT

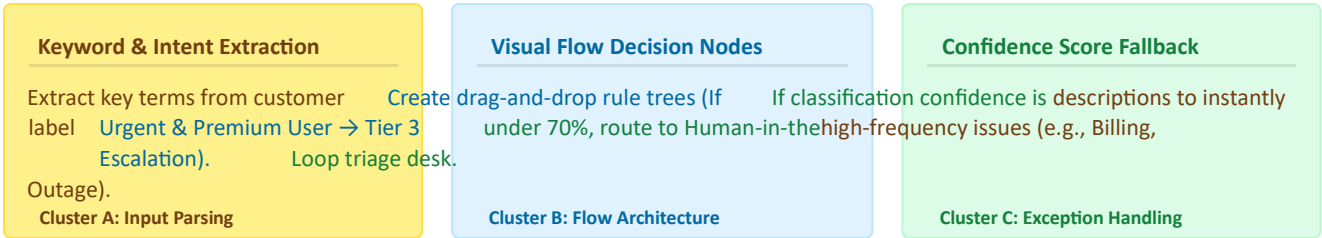

"How might we design an automated ticket classification system using visual flow structures to drastically reduce manual triage time, route issues accurately to target teams, and maintain transparent decision logic?"

KEY RULES OF BRAINSTORMING

- 1. Deter Judgment**
Encourage out-of-the-box flow logic without early criticism.
- 2. Aim for Volume**
Generate multiple routing branches, conditions, and categorization criteria.
- 3. Build on Ideas**
Combine rules, automated tags, and machine learning fallback steps.

STEP 2: BRAINSTORM, IDEA LISTING & GROUPING

Group similar concepts, triage mechanisms, and decision steps into structured clusters.

STEP 3: IDEA PRIORITIZATION MATRIX

Map proposed features across Feasibility vs. Business Importance to establish phase deliverables.
