

IDEATION PHASE | EMPATHIZE & DISCOVER

Auto Ticket Classification Using Flow Design

Empathy Map Canvas Framework: An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviors and attitudes. It is a powerful tool to help product and engineering teams better understand operational persona dynamics, align on core workflows, and build tailored solutions.

Problem Statement Context: Creating an effective solution requires understanding the true operational problem and the team members experiencing it daily. This exercise maps out goals, operational hurdles, and functional considerations for managing automated ticket triage and classification workflows.

Canvas Structure Overview

THINK & FEEL

- What really counts to the user?
- Major preoccupations & day-to-day focus
- Worries, anxieties, and operational aspirations

HEAR

- What colleagues and peers say
- Direct guidance from management
- System alerts, queues, and notification chatter

SEE

- The immediate support system environment
- Team bottlenecks & operational friction
- Existing market tools and alternative solutions

SAY & DO

- Public stance and daily workflow behavior
- Direct interactions with team and software tools
- Workarounds currently in practice

PAIN

- Operational fears and SLA breaches
- Workflow frustrations and repetitive labor
- Technical obstacles in rule management

GAIN

- Core wants, needs, and functional priorities
- Key performance indicators & measures of success
- Automation goals and workflow speedups

EMPATHY MAP CANVAS EXECUTION

Auto Ticket Classification Using Flow Design

Target Persona: IT Service Desk Manager / Support Operations Lead handling high volumes of unstructured support tickets manually.

THINK & FEEL

- How to categorize incoming tickets automatically?
- Manual triage is slow, inefficient, and error-prone.
- Worried about wrong priority assignments during critical incidents.
- Can visual flow builders simplify complex classification rules?
- Need significantly faster Response Time (SLA compliance).

HEAR

- Agents complain about misrouted and incorrectly tagged tickets.
- Management demands lower resolution times and reduced backlog.
- End users asking: "Why is my ticket still pending assignment?"
- System chatter from legacy triggers firing incorrectly.

SEE

- Unsorted ticket queues overflowing during peak service hours.
- Complex conditional branching without visual flow representation.
- Repetitive manual tagging & category selection by team members.
- Disparate tools failing to integrate cleanly with ticket intake.

SAY & DO

- Spends 2+ hours daily manually routing incoming tickets.
- Designing visual flow charts to map out prospective ticket paths.
- Testing keyword & AI classification logic for precision.
- Looking for easy drag-and-drop flow interfaces for operational team.
- Trying actively to reduce ticket resolution delays.

PAIN

- Hard to maintain complex custom rule scripts across updates.
- Misclassified high-priority emergency tickets disrupting operations.
- Agent fatigue from repetitive, high-volume manual routing work.

GAIN

- Instant automatic routing via intuitive visual flow design.
- Higher classification accuracy leading to lower overall SLAs.
- Easy-to-edit flow diagrams for quick rule and condition updates.
