

Date	01 October 2026	Team ID	SWTID-2026-1536
Project Name	AUTO TICKET CLASSIFICATION USING FLOW DESIGN	Maximum Marks	2 Marks

PROJECT DESIGN PHASE

Proposed Solution Template

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Manual IT support ticket triage is slow, prone to human misclassification, and costly. Support teams spend excessive hours reading, categorizing, and routing high-volume incoming tickets, leading to delayed response times, SLA breaches, and high engineer burnout.
2.	Idea / Solution description	An automated, drag-and-drop Flow Design framework that visualizes and executes ticket classification logic. It chains Natural Language Processing (NLP/LLM) nodes, rule-based decision trees, and escalation conditions into a unified workflow to automatically extract intents, assign priorities, and route tickets to appropriate support tiers in real-time.
3.	Novelty / Uniqueness	Unlike "black-box" machine learning algorithms or rigid IF/THEN static rules, this flow design provides a visual, explainable, and modular pipeline . Non-technical support leads can dynamically modify classification logic, inject custom LLM prompts, and inspect step-by-step audit logs for every routing decision without writing code.
4.	Social Impact / Customer Satisfaction	Reduces average ticket first-response time by up to 80% and eliminates manual routing errors. Boosts overall Customer Satisfaction (CSAT) scores, ensures critical high-priority incidents get routed instantly, and relieves support teams from tedious, repetitive admin work.
5.	Business Model (Revenue Model)	B2B SaaS Tiered Model: • Usage-based: Priced per classified ticket volume (e.g., \$0.02 per ticket). • Enterprise Subscription: Monthly/Annual recurring plan based on active flow nodes, custom CRM integrations (Jira, ServiceNow, Zendesk), and dedicated SLA support.
6.	Scalability of the Solution	Built on cloud-native serverless architecture (AWS Lambda / Bedrock / API Gateway) capable of processing millions of incoming webhooks concurrently. The modular flow node design allows seamless addition of multilingual classifiers, sentiment analysis, and multi-tenant ITSM platforms as operations scale.
